

Bio-services | Waste Pipes

The Royal Buckinghamshire Hospital

Wesley Rankin is the facility manager at The Royal Buckinghamshire Hospital. It is his responsibility to ensure the facility remains functional, conforms to health & safety regulations and provides a trouble free clean environment for its residents. These are all important factors for upholding the reputation of the facility.

Over the course of a year Wesley was spending a great deal of time dealing with problems associated with the building's waste pipe system and drains. He had to arrange for contractors to jet wash every six months the problematic areas of the waste pipe system, which was putting stress on the joints and pipe work. He also had to deal with the problem of fat building up in the kitchen sinks and connecting pipes. This was causing nasty smells and the pipes to clog up forcing him to make emergency call outs to unblock the system.

These kinds of problems are unpleasant issues to solve, quite expensive and may have a negative impact on a facility's occupants and reputation.

Wesley decided to solve these issues by purchasing a **biological drain cleaning service** from BIO-ENZYM Ltd. One of our specialists attended the facility and within two hours, application of powerful biological enzymes had been made with minimal disruption to the facility. This process is repeated every six months to boost the system.

Wesley saved the facility over **10%** on its annual waste pipe system maintenance costs and even has a solution for all areas of the facility, not just those problematic ones, including eight external apartments. He is now able to focus on more important issues at the facility safe in the knowledge that the aforementioned problems have been solved, and in an ecological way.
